Looking After Your Joints

Contents

We're the 10 million people living with arthritis. We're the carers, researchers, health professionals, friends, and parents all united in our ambition to ensure that one day, no one will have to live with the pain, fatigue, and isolation that arthritis causes. We understand that every day is different. We know that what works for one person may not help someone else. Our information is a collaboration of experiences, research, and facts. We aim to give you everything you need to know about your condition, the treatments available, and the many options you can try, so you can make the best and most informed choices for your lifestyle.

We're always happy to hear from you whether it's with feedback on our information, to share your story, or just to find out more about the work of Versus Arthritis. Contact us at content@versusarthritis.org

- Talk to us

I realised I wasn't alone. Lots of people in all age groups were just like me. It was like magic. This was where I learnt about aids, pacing, and adapting and accepting help from people. Now, using joint protection, I could keep my joints as healthy as possible. For me, joint protection is about making sure you use your body properly, so posture is important. It's about lifting things safely. For instance, I often 'cuddle' things to get them from one place to another, like my milk container. I don't buy a 6-pint of milk because that's too heavy and I also use a kettle tipper. The kettle is secured in a 'cradle' that can tip without me having to carry it.

I love gardening too. To make sure I pace myself, I listen to a podcast and only work for the length of the podcast. Then I stop or change to a task that uses my body differently. I also use splints to help my wrists stay safe and I have a box on wheels, which I can sit on while I work.

Yvonne's Story

With hindsight, I am sure my symptoms began in my early 20s. I was working as a teacher, but my symptoms kept gradually getting worse over the years. I had pain everywhere, I was stiff, I was aching, and I was muddled. By 45, I was finding teaching difficult, so I went to the GP for help. Sadly, I never went back into the classroom again. It turned out that I had osteoarthritis in most of my joints, Raynaud's phenomenon, and fibromyalgia. Later, I also developed Sjögren's syndrome.

When I took time out of the classroom, my pain levels soared. I kept a pain diary. It hurt to get out of bed, it hurt to stay in bed. It was just an awful time for me. Then my GP signed me onto a course, and it was my turning point.

I've also adapted how I garden. Over time, we have built some raised beds. They are up to my knee height so I can sit on them. Physical activity is so important too. I stay active by being in the garden, going out, tackling housework, and being with my grandchildren. But I also do exercises that strengthen my knees, hips, and shoulders. I have a routine that I follow closely. After doing these exercises for two weeks I started to feel the difference and I notice it when I skip them.

Twenty years on from that desperate time, I feel great. I only have one joint replacement, I'm sure that the exercise has kept the joints going longer. I'd say that if you are new to joint protection, don't try to do a million things at once. Just choose one thing you want to be able to do. Then remember there are lots of people who have already tackled this problem – you don't have to do it all yourself. Ask around for ideas, use the internet, use health professionals and people like your occupational therapist. Take your time and then go for it.

What is Joint Protection?

What is a joint and how does it work?

When you're dealing with joint pain, everyday tasks such as getting in and out of the shower, getting dressed, or making the bed can feel like a struggle. A joint is where two or more bones meet and they allow different types of movement. However, you can reduce the pain and strain on your joints by changing the way you do things. This is called joint protection or joint care.

The joint is held together by a capsule, which stops the bones from moving too far, and inside the capsule, there is an inner lining called the synovium. This makes a thick fluid, known as synovial fluid, that protects the joint. Joint protection doesn't mean that you should avoid using your joints. It's simply about using your body in a way that doesn't strain or damage them.

The ends of the bones are covered with a thin layer of slippery tissue called cartilage. This acts as a protective cushion, stopping the bones from rubbing against each other. In this booklet, we'll look at some of the tasks that commonly cause joint pain, explain what joint protection means, and show you how to make it part of your daily life.

Your muscles are attached to tendons, which are attached to bones. When we move, our muscles pull the tendons, which then pull our bones in certain directions.

What are the Benefits of Joint Protection?

Why should I protect my joints?

Research has shown that joint protection can help to reduce pain and make everyday activities easier. Many people with arthritis also say that they have less stiffness in the

morning and fewer flare-ups when they use these techniques regularly. A flare-up, or flare, is a period where your symptoms come back or get worse.

Everyone should look after their joints. But joint care is particularly important for people with arthritis because it can:

- reduce pain and inflammation.
- help you deal with fatigue.
- allow you to continue your daily activities.

Arthritis can make daily activities even more challenging. The main obstacles people face are:

- joint pain and aching muscles
- loss of strength
- extreme fatigue, especially at the end of the day
- frustration when everyday tasks take longer to do
- worries about having to rely on other people for help.

However, by taking good care of your joints, you could make everyday tasks a little easier.

Helpline: 0800 5200 520

How Do Joints Become Damaged?

If you have arthritis, your muscles may weaken over time, causing the joint to become unstable. Your bones and cartilage may become damaged, and eventually, your joints may change shape. If you have an inflammatory type of arthritis that causes pain, swelling, and stiffness in your joints, such as rheumatoid arthritis, your ligaments supporting the joint capsule can be stretched due to repeated joint swelling. The way you use your joints can contribute to these problems becoming worse, so that's why joint protection is important.

When Should I Start Looking After My Joints?

We rely on our joints for almost every movement we make. So, it's best to make joint protection a daily habit. Joint care is a useful skill for any part of the body. But pay special attention to any joints that are affected by arthritis – for instance, if a joint feels painful, weaker, or is changing shape. It may take a little getting used to, but even small changes could make a big difference.

You may also notice pain and reduced movement of your fingers and thumbs. Even if your joints are already sore, joint protection techniques can help ease the pain. Plus, joint protection can prevent further damage to your joints.

Your hands are particularly at risk because they have many small joints and are used a lot. You may have problems with activities that need a good grip or coordination, such as writing, using your mobile phone, or fastening buttons.

On clothes, capsule and ligaments slacken.

Short-term Ways to Tackle Joint Pain and Stiffness

There are plenty of ways you can look after your joints. Exercise can keep your joints strong and reduce fatigue and stiffness. Meanwhile, getting a good night's rest can help you better manage pain and fatigue. However, pain can be unpredictable. Some days it might be harder than others to keep moving and that's okay. Just listen to your body and be kind to yourself.

Helpline: [0800 5200 520](tel:08005200520)

Visit: [versusarthritis.org](https://www.versusarthritis.org)

If you're having a flare-up or are in severe pain, here are a few ways you might be able to get relief. Then, when you're ready, try some of our long-term tips to protect your joints from further damage.

Take Painkillers

If you're experiencing chronic pain, your doctor may prescribe painkillers. There are many different types including:

- **Non-opioid painkillers** – such as paracetamol.
- **Anti-inflammatory drugs** – such as ibuprofen or naproxen.
- **Compound painkillers** – this is when two different drugs are combined into one.

Your doctor will try and find the right painkiller for you depending on your situation and condition. This will help you stay active and keep moving. Find out more in our [Painkiller & NSAIDs booklet](#).

Footcare

If you have long-term foot problems, you might want to talk to your doctor, orthotist or podiatrist. A podiatrist is a healthcare professional who treats foot problems. They can tell you how to best look after your feet and may recommend that you try orthotics. These are insoles, inserts or specially made shoes that are designed to relieve pain and correct changes in your feet. An orthotist is a healthcare professional who specialises in providing devices, such as splints and insoles, to support weakened joints, reduce pain and improve your mobility. Some devices are made-to-measure. For more information, check out our [Footcare and Footwear booklet](#).

If you're on the lookout for footwear recommendations, be sure to check out our online community where you'll find first-hand tips and advice from people with arthritis: community.versusarthritis.org

Look After Your Feet

Having sore feet can make it harder to get out of the house. That's why comfortable shoes are essential. Wearing good, supportive, properly fitting footwear can help improve your balance and posture. This reduces strain on your joints too. It's worth getting your feet measured each time you shop for new footwear. Remember that your feet change shape throughout your life.

Use Splints

Wearing splints might offer some relief if you have painful, weak, or swollen joints. There are two types of hand and wrist splints you can choose from – working and resting splints. If you're unsure which one is for you, an occupational therapist can explore the options with you. Or you may be referred to a hand therapist. A hand therapist is an occupational therapist or physiotherapist who gives advice on exercises and treatments to improve and maintain the use of the hands. There are different types of splints including:

- **Working splints** which provide support to help reduce pain while you're working or going about your daily activities.

- **Resting splints**, which are designed to be worn at night if you have pain that affects your sleep or when resting (for example, when watching TV during the day). They have a custom-made cradle with straps to hold it in place.
- Some people find that compression (isotoner) gloves are also helpful in reducing pain and swelling and are easier to wear. These can be worn day or night when working or resting.

Read more information about splints at versusarthritis.org/about-arthritis/treatments/splints/

Long-term Ways to Reduce Joint Pain and Stiffness

Painkillers, gadgets, and splints can offer quick relief. But if you really want to prevent further damage and pain, it's important to keep moving and practise joint protection. Making these habits isn't always easy. But even small changes could make everyday tasks such as cooking, cleaning, dressing, and washing a bit easier. Here are some examples of joint protection:

- Notice any pain you feel and use it as a warning.
- Spread the weight over several joints when carrying things.
- Reduce the effort you put in – labour-saving gadgets can be a great help.
- Avoid gripping things tightly.
- Avoid positions that push your joints into awkward positions as this could lead to further problems.
- Use your joints in more stable positions.
- Stop and think about how you could do something differently if it hurts you.

Respect Your Pain

Pain is a common symptom for many people with arthritis and it doesn't always mean that you're damaging your joints. It can be hard, but it's important to stay active if you have arthritis because stopping movement could cause more damage to your joints. However, if you're in serious pain or feel like your pain is getting worse, it's not something to ignore. It might be a warning sign that you are pushing yourself too far and need to pace yourself or adapt the activity so it's suitable for you.

Use Stronger Joints to Do Jobs

When carrying items, it's best to use larger joints where possible because these are protected by stronger muscles. Try the following tips:

- Use your hip or shoulder instead of your hand to close a drawer or door.
- Hug larger objects close to your body as you carry them.
- Carry bags on your forearms instead of using your hands, as they are less likely to get injured.

Use stronger joints for simple tasks. Hug large objects close to your body, so the weight is supported by larger, stronger joints. Try to notice any aches and pains you may have and take a break every half an hour or so. If you're still having pain, try taking more breaks next time as it might mean you can keep going for longer. Many people will give up an activity or a hobby, such as gardening, if it hurts, but it's better to do a little at a time, with plenty of rest, rather than give up something you enjoy. Ask yourself: how are you using the joints that hurt the most? Can you think of another way of doing things? Let's say your hands hurt when you are making a cup of tea. You could try to pick up the kettle with two hands instead of one. Or, if you're struggling to stand for long periods, you could try to do some tasks sitting down.

Spread the Load Over Several Joints

If you're carrying a heavy item, spread the load across several joints. For example, you could use two hands to carry heavy plates. This will put less strain on one joint in particular. The more joints you use to do a job, the better. Pushing yourself too hard can make your joints more painful. So don't do too much all at once. Instead, try to make things easier for yourself. Try these tips:

- Ask for help, where possible.
- Reduce the weight of what you lift. For instance, if you're moving a heavy cardboard box, you could take a few items out before lifting it.
- If you can't reduce the weight, slide objects along a work surface or use a trolley or wheelbarrow.
- Use labour-saving aids and adaptations to make tasks a bit easier.
- Use two hands.
- Keep as much of your hand as possible in contact with the object.
- Avoid gripping with your thumbs.

Aids are items of equipment that can help you manage everyday tasks such as dressing, cooking and walking. They can include walking aids, easy-to-use kitchen utensils and

cutlery with large handles. Adaptations are changes made to your home to help you move around. They can include fixed ramps and baths with built-in handles. If you're struggling to do an activity, aids and adaptations could help you to live independently at home. For example, if you're worried about falls and have been inactive for a while, you might find a walking stick gives you the confidence you need to keep moving. Many people with arthritis are eligible to have aids and adaptations provided, free of charge, by their local authorities. Your council may call this 'community equipment'. To see what you're eligible for, ask your council for a free needs assessment. It varies a lot depending on your needs and where you live. If you're already seeing an occupational therapist, they will assess your needs.

Your needs and provide you with aids, where needed. For more information, visit [versusarthritis.org](https://www.versusarthritis.org) or call the Helpline at 0800 5200 520.

Tips to Reduce Joint Strain:

- Take frequent breaks and rest your hands briefly.
- Try to loosen your grip.
- Reduce the length of time you spend doing these activities.
- Use a padded handle to widen your grip.

Arthritis can damage your joints over time, which can cause your bones and joints to be pushed out of their correct position. This might make everyday tasks hard, painful, or impossible. Your hands are most likely to be affected because they have lots of small joints and are constantly used.

Avoid These Positions:

- Lifting heavy objects with your wrists bent downwards.
- Using too few joints to do a job, like carrying a bag with a few fingers.
- Pushing your fingers over towards your little finger and putting pressure on your thumb.
- Twisting or over-straightening your fingers.

For more information, check out our *Gadgets and Equipment for Your Home* booklet or visit [versusarthritis.org/about-arthritis/living-with-arthritis/your-home/](https://www.versusarthritis.org/about-arthritis/living-with-arthritis/your-home/). You can also find gadgets specially designed for people with arthritis at [arthr.com](https://www.arthr.com).

Using Joints in More Stable Positions:

Try to use your joints in stable positions that spread the weight evenly over several joints. Don't push your joints too far. If something is out of reach, get up and move closer to it, rather than stretching into an awkward position.

Tips for Joint Stability:

- Pour with two hands instead of one.
- Use a cup with a larger, straighter handle.
- Carry papers with both hands.
- Sit or stand as close as you can when working at a table or bench.
- Keep your weight supported evenly through both legs.
- Use a grip that keeps your wrists straight and fingers in line with your wrist.
- When lifting objects, keep your elbow bent and in front of your body.

Making Changes:

Joint care at work can be challenging, but making changes bit by bit can help. Write down the benefits of making changes to remind yourself why you need to stick with it. If you find it difficult, pick a task causing the most pain and make one change at a time.

Tips for Workplace Joint Care:

- Work out another way of doing tasks that cause less pulling or pain.
- Practise new movements until they become automatic.
- Take breaks and stand up every 30 minutes if working at a computer.
- Ensure work surfaces are at the correct height to avoid stooping or stretching.
- Adjust your chair so your hips and knees are at right angles.

Getting Joint Care Support at Work:

If living with arthritis or joint pain affects your work, understand your options and rights. Your employer might need to make reasonable adjustments, like changing work hours or providing special equipment. An occupational therapist or a Disability Employment Advisor (DEA) can help with assessments and advice.

Contact a DEA through your local Jobcentre Plus office. You could also get support from the Access to Work Scheme. For more information on working with arthritis, visit

Will Exercise Help My Joint Pain?

Many people with arthritis worry that exercise could further damage their joints. However, exercising is beneficial as it reduces symptoms like pain and fatigue and improves mental health.

Exercise Tips:

- Start slowly and build up gradually.
- Try low-impact activities like walking, cycling, tai chi, or yoga.
- Exercise with a friend or in a group for motivation.
- Check out online exercise classes on the Versus Arthritis website.

For more advice, check out our *Keep Moving* booklet or visit versusarthritis.org/exercise.

Improving Your Grip:

Regular hand exercises can improve your grip. Practise them daily for short periods. Start slowly and build up over several weeks. If your hand is painful, you could use warm water and a sponge to ease discomfort.

To soothe any sore or achy joints, ask to be referred to an occupational therapist, physiotherapist, or hand therapist if you want more exercises to suit your needs. A physiotherapist, for example, helps people with an injury or long-term health condition be active and independent. They'll offer movements, exercises, manual therapy, education, and advice to help ease your pain and move your muscles and joints more easily.

Helpline: 0800 5200 520

If you don't know where to start, try these hand exercises below:

Hand Exercises

Finger Tendon Glide Stretch

- Start with the fingers extended straight out.

- Make a hook fist, return to a straight hand.
- Make a full fist, return to a straight hand.
- Make a straight fist, return to a straight hand.

Thumb Stretch

Hold your hand out in front of you, as if you're saying stop. Begin with your thumb positioned outward. Move the thumb across your palm and then back to the starting position.

Wrist Turn

Bend your elbow to 90 degrees with your palm facing down. Rotate your forearm, so that your palm faces up and then down.

For more information, check out our [Managing Fatigue booklet](#) or visit our website.

How to Manage Fatigue

Fatigue isn't the same as tiredness. It's extreme mental and physical exhaustion that doesn't improve with rest or sleep. It's unsurprising that many people with arthritis feel fatigued. Living in constant joint pain can wear you down. Many arthritis medicines can make you feel sleepy. Plus, sleep disturbance and low mood can make you feel exhausted. Fatigue is an invisible symptom, but it can be debilitating and affect your day-to-day life. However, you can help make your energy last a bit longer by:

- Practising joint protection
- Pacing yourself and avoiding the 'boom-and-bust' cycle
- Planning and setting priorities
- Finding a less tiring position to do activities in
- Becoming better organised
- Taking time to rest throughout the day
- Practising relaxation techniques, such as meditation or deep breathing

Healthy Diet for Joint Health

It's important to eat a healthy, balanced diet if you have arthritis. This will give you all the nutrients you need such as calcium, vitamin D, and iron. Some people take dietary supplements to help protect their joints. Research results are mixed though, so if you decide

to try supplements, you should question what they're doing for you. Then decide if you want to continue taking them depending on whether you notice any improvement. Plus, it'll help you maintain a healthy weight. Being overweight puts an extra burden on the joints in your knees, hips, ankles, and feet, causing pain and mobility problems.

For more advice on maintaining a healthy diet, check out our [Eating Well with Arthritis booklet](#).

Your plate should include a variety of foods from all five food groups. This includes:

- Fruit and vegetables
- Potatoes, bread, rice, pasta, and other starchy carbohydrates
- Beans, pulses, fish, eggs, meat, and other proteins
- Dairy and alternatives
- Oils and spreads

Eating a Mediterranean-style diet is a good option, because it is packed with lots of fruit and vegetables, oily fish, nuts, seeds, and olive oil.

Support and Encouragement

If you're struggling to look after your joints, remember that you're not alone. There are healthcare professionals, local groups, and friends and family who can all help to provide support and encouragement.

Healthcare Professionals

If you need a helping hand with joint care, many healthcare professionals can give you advice. These include:

- Nurses
- Occupational therapists
- Physiotherapists
- Hand therapists
- Podiatrists

Joint Protection Programmes

Because changing the habits of a lifetime can be very difficult to do, many people find it helpful to get together with others who wish to do the same. Many occupational therapy departments offer joint protection programmes, where you can learn more about joint protection and swap tips with other people. If you find the self-help methods suggested here useful, you may like to join a local group. The National Rheumatoid Arthritis Society (NRAS) also runs a programme for people with rheumatoid arthritis. There are similar programmes available locally for people with long-term medical conditions like arthritis. Be sure to ask your doctor's surgery or rheumatology unit about the NHS Expert Patient Programme too.

Family and Carers

Learning about joint protection may help your family and carers better understand some of the problems people with arthritis face. Some people find it very helpful to get their family or friends involved as they practise some of the ideas mentioned in this booklet. You may find that it's easier to make joint protection a habit if you have support and feedback.

Exercising is good for us. Not only does it reduce symptoms such as pain and fatigue, but it's great for your mental health too.

Where Can I Find Out More?

If you've found this information useful, you might be interested in other titles from our range. You can download all of our booklets from our website www.versusarthritis.org or order them by contacting our Helpline.

Bulk Orders

For bulk orders, please contact our warehouse, APS, directly to place an order:

- Phone: 0800 515 209
- Email: info@versusarthritis.org

You don't need to face arthritis alone. Our advisors aim to bring all of the information and advice about arthritis into one place to provide tailored support for you.
